

## Description

Avago Technologies' AEDT-981x encoders are industrial grade high temperature ( -40 to $115^{\circ} \mathrm{C}$ ) rating three channel optical incremental encoder modules building on the Avago legacy HEDS-9140 series.
Using an Avago developed opto ASIC with the built-in Interpolator circuit, AEDT-981x encoders enable wide resolution range from 2000 to 5000 count per revolution with the rotary codewheel of 11 mm optical radius, offering a high resolution yet compact solution.
With the opto-ASIC's built-in automatic LED brightness regulation technique, the encoder current consumption can be significantly lowered (Typ. Icc: 20 mA ) while maintaining optimal encoder performance across spatial corners. This LED brightness control feature also enables optimal LED current control hence LED life can significantly pro-longed.

With the state of the art opto-mechanical design, AEDT$981 x$ offers excellent spatial play of $\varnothing 0.40 \mathrm{~mm}$ and code wheel gap range of $\pm 150$ um. This allows great flexibility and ease of installation to the user.
Inheriting the indefeasible integrity in product robustness, repeatability and reliability, AEDT-981x series are designed for wide market employment withstanding wide application requirement and environment demand.

## Features

- $-40^{\circ} \mathrm{C}$ to $115^{\circ} \mathrm{C}$ Operating Temperature
- Two Channel Quadrature Output with Index Pulse
- Single ended output with $\pm 5 \mathrm{~mA}$ output sink/source current per channel
- Suitable for Industrial Applications
- Resolution up to 5000 Counts per Revolution
- Low Power Consumption (Typical Icc: 20 mA )
- No Signal Adjustment Required
- Pin Compatible to legacy HEDS-9xxx Series
- Spatial play tolerance of $\varnothing 0.40 \mathrm{~mm}$
- Allows motor shaft axial play of $\pm 0.15 \mathrm{~mm}$
- ESD Immunity HBM 4kV (JESD22-A114D)

## Applications

The AEDT-981x series provide high temperature motion control detection with ease of installation, making them suitable for wide range of commercial \& industrial applications.

Note: Avago Technologies encoders are not recommended for use in safety critical applications. Eg. ABS braking systems, power steering, life support systems and critical care medical equipment. Please contact sales representative if more clarification is needed.

## Mounting Considerations with Aligning Pin

The AEDT-981X can be mounted using fixed aligning pins on the motor base. For this configuration, Side A or B can be used as the mounting plane as shown.

MODULE SIDE A AS MOUNTING PLANE

## Orientation of Artwork for Codewheels

The Index area on the AEDT-981X series encoder modules has a nonsymmetrical pattern as does the mating Codewheel. In order for the Index to operate, the "Rightreading" side of the Codewheel disk (the "Artwork Side") must point toward "Side A" of the Module (the side with the connecting pins).

Because the Encoder Module may be used with either "Side A" or with "Side B" toward the mounting surface, care must be taken to orientate the code wheel artwork side according to Figure below.

## Definitions

Count ( N ): The number of bar and window pairs or counts per revolution (CPR) of the codewheel
One Cycle (C): 360 electrical degrees ( ${ }^{\circ} \mathrm{e}$ ), 1 bar and window pair

One Shaft Rotation: 360 mechanical degrees, N cycles
Position Error $(\Delta \Theta)$ : The normalized angular difference between the actual shaft position and the position indicated by the encoder cycle count

Cycle Error ( $\Delta \mathrm{C}$ ): An indication of cycle uniformity. The difference between an observed shaft angle which gives rise to one electrical cycle, and the nominal angular increment of $\mathrm{I} / \mathrm{N}$ of a revolution

Pulse Width ( P ): The number of electrical degrees that an output is high during 1 cycle. This value is nominally $180^{\circ} \mathrm{e}$ or $1 / 2$ cycle

Pulse Width Error ( $\Delta \mathrm{P}$ ): The deviation, in electrical degrees, of the pulse width from its ideal value of $180^{\circ} \mathrm{e}$

State Width (S): The number of electrical degrees between a transition in the output of channel $A$ and the neighboring transition in the output of channel $B$. There are 4 states per cycle, each nominally $90^{\circ}$ e.

State Width Error ( $\Delta \mathrm{S}$ ): The deviation, in electrical degrees, of each state width from its ideal value of $90^{\circ} \mathrm{e}$.

Phase ( $\phi$ ): The number of electrical degrees between the center of the high state of channel A and the center of the high state of channel $B$. This value is nominally $90^{\circ}$ e for quadrature output.
Phase Error $(\Delta \phi)$ : The deviation of the phase from its ideal value of $90^{\circ} e$.

Direction of Rotation: When the codewheel rotates in the direction of the arrow on top of the module, channel A will lead channel $B$. If the codewheel rotates in the opposite direction, channel B will lead channel A.

Optical Radius (Rop): The distance from the codewheel's center of rotation to the optical center (O.C.) of the encoder module.

Index Pulse Width $\left(\mathrm{P}_{\mathrm{o}}\right)$ : The number of electrical degrees that an index is high during one full shaft rotation. This value is nominally $90^{\circ}$ e or $1 / 4$ cycle.

## Electrical Interface

The AEDT-918x Series encoders output circuitry are designed with high speed and high drivability sink/source output of $\pm 5 \mathrm{~mA}$ without the need of pull up resistors. The high drivability offers rail to rail $\mathrm{V}_{\mathrm{OH}}$ and $\mathrm{V}_{\mathrm{OL}}$ giving the end customer better noise margin in signal processing hence more reliable in industrial application.
